

Package: ggparty (via r-universe)

August 21, 2024

Title 'ggplot' Visualizations for the 'partykit' Package

Version 1.0.0

Copyright file inst/COPYRIGHTS

Description Extends 'ggplot2' functionality to the 'partykit' package. 'ggparty' provides the necessary tools to create clearly structured and highly customizable visualizations for tree-objects of the class 'party'.

Maintainer Martin Borkovec <martin.borkovec@skyforge.at>

Depends R (>= 3.4.0), ggplot2, partykit

Imports grid, gtable, utils, checkmate, methods, survival, rlang

Suggests testthat, mlbench, AER, coin, vdiff, knitr, rmarkdown, pander, MASS, TH.data

autoplot.party	<i>autoplot methods for party objects</i>
----------------	-------------------------------------------

Description

autoplot methods for party objects

Usage

```
## S3 method for class 'party'
autoplot(object, ...)

## S3 method for class 'constparty'
autoplot(object, ...)

## S3 method for class 'modelparty'
autoplot(object, plot_var = NULL, ...)

## S3 method for class 'lmtree'
autoplot(object, plot_var = NULL, show_fit = TRUE,
  ...)
```

Arguments

object	object of class party.
...	additional parameters
plot_var	Which covariate to plot against response. Defaults to second column in data of tree.
show_fit	If TRUE fitted_values are drawn.

Examples

```

library(ggparty)

data("WeatherPlay", package = "partykit")
sp_o <- partysplit(1L, index = 1:3)
sp_h <- partysplit(3L, breaks = 75)
sp_w <- partysplit(4L, index = 1:2)
pn <- partynode(1L, split = sp_o, kids = list(
  partynode(2L, split = sp_h, kids = list(
    partynode(3L, info = "yes"),
    partynode(4L, info = "no"))),
  partynode(5L, info = "yes"),
  partynode(6L, split = sp_w, kids = list(
    partynode(7L, info = "yes"),
    partynode(8L, info = "no")))))
py <- party(pn, WeatherPlay)

autoplot(py)

```

geom_edge

*Draw edges***Description**

Draws edges between children and parent nodes. Wrapper for [ggplot2::geom_segment\(\)](#)

Usage

```
geom_edge(mapping = NULL, nudge_x = 0, nudge_y = 0, ids = NULL,
  show.legend = NA, ...)
```

Arguments

mapping	Mapping of x, y, xend and yend defaults to ids' and their parent's coordinates. Other mappings can be added here as aes().
nudge_x, nudge_y	Nudge labels.
ids	Choose which edges to draw by their children's ids.
show.legend	logical See layer() .
...	Additional arguments for geom_segment() .

See Also

Examples

```

library(ggparty)
data("WeatherPlay", package = "partykit")
sp_o <- partysplit(1L, index = 1:3)
sp_h <- partysplit(3L, breaks = 75)
sp_w <- partysplit(4L, index = 1:2)
pn <- partynode(1L, split = sp_o, kids = list(
  partynode(2L, split = sp_h, kids = list(
    partynode(3L, info = "yes"),
    partynode(4L, info = "no"))),
  partynode(5L, info = "yes"),
  partynode(6L, split = sp_w, kids = list(
    partynode(7L, info = "yes"),
    partynode(8L, info = "no")))))
py <- party(pn, WeatherPlay)

ggparty(py) +
  geom_edge() +
  geom_edge_label() +
  geom_node_label(aes(label = splitvar),
                 ids = "inner") +
  geom_node_label(aes(label = info),
                 ids = "terminal")

```

geom_edge_label	<i>Draw edge labels</i>
-----------------	-------------------------

Description

Label edges with corresponding split breaks

Usage

```

geom_edge_label(mapping = NULL, nudge_x = 0, nudge_y = 0,
               ids = NULL, shift = 0.5, label.size = 0,
               splitlevels = seq_len(100), max_length = NULL, parse_all = FALSE,
               parse = TRUE, ...)

```

Arguments

mapping	Mapping of label defaults to breaks_label . Other mappings can be added here as <code>aes()</code> .
nudge_x, nudge_y	Nudge label.
ids	Choose which splitbreaks to label by their children's ids.
shift	Value in (0,1). Moves label along corresponding edge.
label.size	See <code>geom_label()</code> .

splitlevels	Which levels of split to plot. This may be useful in the presence of many factor levels for one split break.
max_length	If provided breaks_label levels will be truncated to the specified length.
parse_all	Defaults to FALSE, in which case everything but the inequality signs of breaks_label are deparsed. If TRUE complete breaks_label are parsed.
parse	Needs to be true in order to parse inequality signs of breaks_label .
...	Additional arguments for geom_label() .

  geom_node_label(aes(label = info),
                 ids = "terminal")
```

geom_node_label

Draw (multi-line) labels at nodes

Description

`geom_node_splitvar()` and `geom_node_info()` are simplified versions of `geom_node_label()` with the respective defaults to either label the split variables for all inner nodes or the info for all terminal nodes.

Usage

```
geom_node_label(mapping = NULL, data = NULL, line_list = NULL,
  line_gpar = NULL, ids = NULL, position = "identity", ...,
  parse = FALSE, nudge_x = 0, nudge_y = 0,
  label.padding = unit(0.25, "lines"), label.r = unit(0.15, "lines"),
  label.size = 0.25, label.col = NULL, label.fill = NULL,
  na.rm = FALSE, show.legend = NA, inherit.aes = TRUE)

geom_node_info(mapping = NULL, nudge_x = 0, nudge_y = 0,
  ids = NULL, label.padding = unit(0.5, "lines"), ...)

geom_node_splitvar(mapping = NULL, nudge_x = 0, nudge_y = 0,
  label.padding = unit(0.5, "lines"), ids = NULL, ...)
```

Arguments

mapping	x and y are mapped per default to the node's coordinates. If you don't want to set line specific graphical parameters, you can also map label here. Otherwise set labels in <code>line_list</code> .
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
line_list	Use this only if you want a multi-line label with the possibility to override the aesthetics mapping for each line specifically with fixed graphical parameters. In this case, don't map anything to label in the <code>aes()</code> supplied to <code>mapping</code> , but instead pass here a list of <code>aes()</code> with the only mapped variable in each being label. Other aesthetic mappings still can be passed to <code>mapping</code> and will apply to all lines and the border, unless overwritten by <code>line_gpar</code> . The order of the list represents the order of the plotted lines.
line_gpar	List of lists containing line-specific graphical parameters. Only use in conjunction with <code>line_list</code> . Has to contain the same number of lists as are <code>aes()</code> in <code>line_list</code> . First list applies to first line, and so on.
ids	Select for which nodes to draw a label. Can be "inner", "terminal", "all" or numeric vector of ids.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
...	Additional arguments to layer.
parse	If TRUE, the labels will be parsed into expressions. Can also be specified per line via <code>line_gpar</code> .

nudge_x, nudge_y	Adjust position of label.
label.padding	Amount of padding around label. Defaults to 0.25 lines.
label.r	Radius of rounded corners. Defaults to 0.15 lines.
label.size	Size of label border, in mm.
label.col	Border colour.
label.fill	Background colour.
na.rm	If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders()</code> .

Details

`geom_node_label()` is a modified version of `ggplot2::geom_label()`. This modification allows for labels with multiple lines and line specific graphical parameters.

geom_node_plot

*Draw plots at nodes***Description**

Additional component for a [ggparty\(\)](#) that allows to create in each node a ggplot with its data. #'

Usage

```
geom_node_plot(plot_call = "ggplot", gglist = NULL, width = 1,
  height = 1, size = 1, ids = "terminal", scales = "fixed",
  nudge_x = 0, nudge_y = 0, shared_axis_labels = FALSE,
  shared_legend = TRUE, predict = NULL, predict_gpar = NULL,
  legend_separator = FALSE)
```

Arguments

plot_call	Any function that generates a ggplot2 object.
gglist	List of additional gg components. Columns of data of nodes can be mapped. Additionally fitted_values and residuals can be mapped if present in party of ggparty()
width	Expansion factor for viewport's width.
height	Expansion factor for viewport's height.
size	Expansion factor for viewport's size.
ids	Id's to plot. Numeric, "terminal", "inner" or "all". Defaults to "terminal".
scales	See facet_wrap()
nudge_x, nudge_y	Nudges node plot.
shared_axis_labels	If TRUE only one pair of axes labels is plotted in the terminal space. Only recommended if ids "terminal" or "all".
shared_legend	If TRUE one shared legend is plotted at the bottom of the tree.
predict	Character string specifying variable for which predictions should be plotted.
predict_gpar	Named list containing arguments to be passed to the geom_line() call of predicted values.
legend_separator	If TRUE line between legend and tree is drawn.

    citations = 1,
    price = exp(seq(from = min(x$log(price/citations)),
                    to = max(x$log(price/citations)),
                    length.out = 100)))
})

ggparty(j_tree, terminal_space = 0.8) +
  geom_edge() +
  geom_edge_label() +
  geom_node_splitvar() +
  geom_node_plot(gglist =
    list(aes(x = `log(price/citations)`, y = `log(subs)`),
         geom_point(),
         geom_line(data = pred_df,
                   aes(x = log(price/citations),
                       y = prediction),
                       col = "red"))))

```

Description

Create data.frame with predictions for each node

Usage

```
get_predictions(party_object, ids, newdata_fun, predict_arg = NULL)
```

Arguments

party_object	object of class party
ids	Id's to plot. Numeric, "terminal", "inner" or "all". MUST be identical to ids of <code>geom_node_plot()</code> used to plot this data.
newdata_fun	function which takes data of node and returns newdata for <code>predict()</code>
predict_arg	list of additional arguments passed to <code>predict()</code>

ggparty

Create a new ggparty plot

Description

ggplot2 extension for objects of class party. Creates a data.frame from an object of class party and calls `ggplot()`

Usage

```
ggparty(party, horizontal = FALSE, terminal_space, layout = NULL,
        add_vars = NULL)
```

Arguments

party	Object of class party.
horizontal	If TRUE plot will be horizontal.
terminal_space	Proportion of the plot that should be reserved for the terminal nodeplots. Defaults to $2 / (\text{depth}(\text{party}) + 2)$.
layout	Optional layout adjustment. Overwrites the coordinates of the specified nodes. Must be data.frame containing the columns id, x and y. With x and y values between 0 and 1.
add_vars	Named list containing either string(s) specifying the locations of elements to be extracted from each node of party or function(s) of corresponding row of plot data and node. In either case returned object has to be of length 1. If the data is supposed to be accessible by <code>geom_node_plot()</code> the respective list entry has to be named with the prefix "nodedata_" and be a function returning a list of same length as nodesize.

Details

ggparty can be called directly with an object of class party, which will convert it to a suitable data.frame and pass it to a call to ggplot with as the data argument. As usual, additional components can then be added with +.

The nodes will be spaced equally in the unit square. Specifying terminal_size allows to increase or decrease the area for plots of the terminal nodes.

If one of the list entries supplied to add_vars is a function, it has to take exactly two arguments, namely data (the corresponding row of the plot_data data frame) and node (the corresponding node, i.e. party_object[i])
